Recently, mercury in the fish is a big problem all over the world. Although fish has always been recognized as an excellent source of protein, the risk of mercury contamination has thrown some of its nutritional benefits into question. In fact, mercury contamination of fish is a definite concern for all individuals, and particularly for women considering pregnancy, pregnant women, and children. Once this mercury gets into the marine food chain, it "bioaccumulates" in the larger predators. That's why larger fish are generally riskier to eat than smaller ones. Which one is true about mercury?

- الف ☐ It is one of the natural components of the bodies of fish all over the world.
- ب ☒ It was not as much of a concern in the past as it is today.
- ج ☐ It is a substance we should ask more questions about to know it better.
- د ☐ Its presence makes fish a poorer source of protein.

Although fish has always been recognized as an excellent source of protein, the risk of mercury contamination has thrown some of its nutritional benefits into question. In fact, mercury contamination of fish is a definite concern for all individuals, and particularly for women considering pregnancy, pregnant women, and children. Once this mercury gets into the marine food chain, it "bioaccumulates" in the larger predators. That's why larger fish are generally riskier to eat than smaller ones. According to the text, which one is correct about eating fish?

- الف ☐ It can be more dangerous for children than it is for pregnant women.
- ب ☐ The protein we take is so important that we must continue eating it.
- ج ☐ It provided people with more protein in the past than it does now.
- د ☒ We must compare its health benefits against the risks it can have.

Recently, mercury in the fish is a big problem all over the world. Although fish has always been recognized as an excellent source of protein, the risk of mercury contamination has thrown some of its nutritional benefits into question. In fact, mercury contamination of fish is a definite concern for all individuals, and particularly for women considering pregnancy, pregnant women, and children. Once this mercury gets into the marine food chain, it "bioaccumulates" in the larger predators. That's why larger fish are generally riskier to eat than smaller ones. Which statement is FALSE?

- ☒ A 'predator' is a general name for any fish that has a large body.
- ☐ Mercury can pass from the body of a fish to another one that eats it.
- ☐ A 'food chain' is the process of eating living things and then being eaten by others.
- ☐ Larger fish are more risky to eat as they might have received mercury from other fish.

The bat is the only mammal that files. In order to avoid objects in its path, it uses a type of radar system. Bats emit ultra-sonic sounds and are able to hear the echoes of these sounds. Their radar system enables them to know the position of the objects in their path and to avoid objects at night. They can estimate the distance of an object by using the sound echoes that bounce back to them. So, while bats may travel in total darkness, they "see" using sounds. They are able to fly at great speed but are unable to walk fast on the ground. A 'mammal' is a general name for any animal that is capable of flying.
