These creatures can be found in many parts of the world. Bats live in cities, deserts, grasslands and forests. There are over one thousand two hundred bat species. Many people think bats are blind, but this is not true. Many species have very good sight. Most bats communicate and find their way by making "echolocation" noises. They produce high-frequency noises and can estimate the distance of an object by using the sound echoes that bounce back to them. So, while bats may travel in total darkness, they "see" using sound.

new research suggests that a once-a-week serving of salmon containing beneficial omega-3 fatty acids can **dramatically** cut your risk of coronary heart disease, something scientists have suspected for decades. That theory was corroborated last year when University of Washington researchers studied 827 Seattle-area residents, looking at **their** diets, and in some cases, their blood samples. The researchers found an inverse link between the risk of primary cardiac arrest and the levels of omega-3 fatty acids in the diet and in the blood. Compared with those who ate no fish, the study participants who ate a serving a week had a 50-percent lower risk. Other university studies suggest that omega-3 fatty acids reduce the risk for cardiac arrest by strengthening our arteries, lowering blood-fat levels and preventing blood clots.
